

Equivariant Cohomology
in
Algebraic Geometry
(draft 2021.8.31)

David Anderson and William Fulton

Contents

Preface	ix
Chapter 1. Preview	1
1. The Borel construction	1
2. Fiber bundles	3
3. The localization package	4
4. Schubert calculus and Schubert polynomials	6
Chapter 2. Defining equivariant cohomology	11
1. Principal bundles	11
2. Definitions	14
3. Chern classes and fundamental classes	18
4. The general linear group	21
5. Some other groups	22
6. Projective space	26
Chapter 3. Basic properties	29
1. Tori	29
2. Functoriality	31
3. Invariance	32
4. Free and trivial actions	35
5. Exact sequences	36
6. Gysin homomorphisms	37
7. Poincaré duality	40
Chapter 4. Grassmannians and flag varieties	43
1. Schur polynomials	43
2. Flag bundles	47
3. Projective space	50
4. Complete flags	51

5. Grassmannians and partial flag varieties	53
6. Poincaré dual bases	58
7. Bases and duality from subvarieties	60
Chapter 5. Localization I	67
1. The main localization theorem (first approach)	67
2. Integration formula	74
3. Equivariant formality	80
Chapter 6. Conics	85
1. Steiner's problem	85
2. Cohomology of a blowup	86
3. Complete conics	89
Chapter 7. Localization II	99
1. The general localization theorem	99
2. Invariant curves	104
3. Image of the restriction map	107
4. The image theorem for nonsingular varieties	111
Chapter 8. Toric varieties	121
1. Equivariant geometry of toric varieties	121
2. Cohomology rings	123
3. The Stanley-Reisner ring	125
4. Other presentations	130
Chapter 9. Schubert calculus on Grassmannians	133
1. Schubert cells and Schubert varieties	133
2. Schubert classes and the Kempf-Laksov formula	135
3. Tangent spaces and normal spaces	138
4. Double Schur polynomials	140
5. Poincaré duality	142
6. Multiplication	145
7. Grassmann duality	149
8. Littlewood-Richardson rules	152
Chapter 10. Flag varieties and Schubert polynomials	161
1. Rank functions and Schubert varieties	161

2.	Neighborhoods and tangent weights	163
3.	Invariant curves in the flag variety	166
4.	Bruhat order for the symmetric group	167
5.	Opposite Schubert varieties and Poincaré duality	171
6.	Schubert polynomials	174
7.	Multiplying Schubert classes	179
8.	Partial flag varieties	181
9.	Stability	183
10.	Properties of Schubert polynomials	185
Chapter 11. Degeneracy loci		193
1.	The Cayley-Giambelli-Thom-Porteous formula	193
2.	Flagged degeneracy loci	196
3.	Irreducibility	197
4.	The class of a degeneracy locus	200
5.	Essential sets	204
6.	Degeneracy loci for maps of vector bundles	205
7.	Universal properties of Schubert polynomials	211
8.	Further properties of Schubert polynomials	212
Chapter 12. Infinite-dimensional flag varieties		221
1.	Stability revisited	221
2.	Infinite Grassmannians and flag varieties	224
3.	Schubert varieties and Schubert polynomials	227
4.	Degeneracy loci	232
Chapter 13. Symplectic flag varieties		241
1.	Degeneracy loci for symmetric maps	241
2.	Isotropic subspaces	242
3.	Symplectic flag bundles	245
4.	Lagrangian Grassmannians	247
5.	Cohomology rings	251
Chapter 14. Symplectic Schubert polynomials		255
1.	Schubert varieties	255
2.	Double Q -polynomials and Lagrangian Schubert classes	265
3.	Symplectic degeneracy loci	268

4. Type C Schubert polynomials	271
5. Properties of type C Schubert polynomials	276
Chapter 15. Homogeneous varieties	281
1. Linear algebraic groups	281
2. Flag varieties	287
3. Parabolic subgroups and partial flag varieties	290
4. Invariant curves	296
5. Compact groups	297
6. Borel presentation	300
Chapter 16. The algebra of divided difference operators	307
1. Push-pull operators	307
2. Restriction to fixed points	311
3. Difference operators and line bundles	316
4. The right W -action	318
5. Left-handed actions and operators	320
6. The convolution algebra	322
Chapter 17. Equivariant homology	329
1. Equivariant Borel-Moore homology and Chow groups	329
2. Segre classes	333
3. Localization	336
4. Equivariant multiplicities	338
Chapter 18. Bott-Samelson varieties and Schubert varieties	345
1. Definitions, fixed points, and tangent spaces	345
2. Desingularizations of Schubert varieties	348
3. Poincaré duality and restriction to fixed points	352
4. A presentation for the cohomology ring	356
5. A restriction formula for Schubert varieties	359
6. Duality	362
7. A nonsingularity criterion	364
Chapter 19. Structure constants	371
1. Chevalley's formula	371
2. Characterization of structure constants	374

3. Positivity via transversality	377
4. Positivity via degeneration	383
Appendix A. Algebraic topology	393
1. Homology and cohomology	393
2. Borel-Moore homology	396
3. Class of a subvariety	397
4. Leray-Hirsch theorem	401
5. Chern classes	403
6. Gysin homomorphisms	405
7. The complement of a variety in affine space	406
8. Limits	407
Appendix B. Specialization in equivariant Borel-Moore homology	413
Appendix C. Pfaffians and Q -polynomials	417
1. Pfaffians	417
2. Schur Q -polynomials	418
3. Double Q -polynomials and interpolation	423
Hints for exercises	430
Appendix D. Schubert conventions	431
1. Grassmannians	431
2. Flag varieties	435
3. General G/P	439
Appendix E. Characteristic classes and equivariant cohomology	441
Bibliography	447
Index	463
