Calculus of differential forms

Definition. A differential k-form is an expression written as a sum of terms which are a function times a wedge product of k differentials of coordinates.

Example of a 2-form.
$$\omega = (x^2 - y) \ dx \wedge dy + \frac{\sin z}{x - y} \ dx \wedge dz + ye^{-x \ln z} \ dy \wedge dz$$
.

- <u>Wedge product</u> is similar to an ordinary product, but it is <u>anticommutative</u> $dx \wedge dy = -dy \wedge dx$. In particular, this implies that the wedge product of two equal differentials is zero $dx \wedge dx = 0$
- <u>Differential</u> of a k-form $\omega = f dx_1 \wedge dx_2 \wedge ... \wedge dx_k$ is equal to the (k+1)-form $d\omega = d(f) \wedge dx_1 \wedge dx_2 \wedge ... \wedge dx_k$. Examples.

(i) If
$$\omega^0 = f(x, y, z)$$
 is a 0-form, then $d\omega^0 = df = \frac{\partial f}{\partial x}dx + \frac{\partial f}{\partial y}dy + \frac{\partial f}{\partial z}dz = f'_xdx + f'_ydy + f'_zdz$.

(ii) If
$$\omega^1 = M(x, y, z)dx + N(x, y, z)dy + P(x, y, z)dz$$
, then

$$\begin{array}{ll} d\omega^1 & = & dM \wedge dx + dN \wedge dy + dP \wedge dz \\ & = & \left(M_x' dx + M_y' dy + M_z' dz \right) \wedge dx + \left(N_x' dx + N_y' dy + N_z' dz \right) \wedge dy + \left(P_x' dx + P_y' dy + P_z' dz \right) \wedge dz \\ & = & \underbrace{M_x' dx \wedge dx}_{} + M_y' dy \wedge dx + M_z' dz \wedge dx \\ & & + N_x' dx \wedge dy + \underbrace{N_y' dy \wedge dy}_{} + N_z' dz \wedge dy \\ & & + P_x' dx \wedge dz + P_y' dy \wedge dz + \underbrace{P_z' dz \wedge dz}_{} \end{array}$$

$$= \quad \left(-M_y' + N_x'\right) dx \wedge dy + \left(-M_z' + P_x'\right) dx \wedge dz + \left(-N_z' + P_y'\right) dy \wedge dz$$

(iii) If
$$\omega^2 = M(x, y, z)dy \wedge dz + N(x, y, z)dz \wedge dx + P(x, y, z)dx \wedge dy$$
, then

$$d\omega^{2} = dM \wedge dy \wedge dz + dN \wedge dz \wedge dx + dP \wedge dx \wedge dy$$

$$= (M'_{x}dx + M'_{y}dy + M'_{z}dz) \wedge dy \wedge dz + (N'_{x}dx + N'_{y}dy + N'_{z}dz) \wedge dz \wedge dx$$

$$+ (P'_{x}dx + P'_{y}dy + P'_{z}dz) \wedge dx \wedge dy$$

$$= M'_{x}dx \wedge dy \wedge dz + M'_{y}dy \wedge dy \wedge dz + M'_{z}dz \wedge dy \wedge dz + N'_{x}dx \wedge dz \wedge dx + N'_{y}dy \wedge dz \wedge dx$$

$$+ N'_{z}dz \wedge dz \wedge dx + P'_{x}dx \wedge dx \wedge dy + P'_{y}dy \wedge dx \wedge dy + P'_{z}dz \wedge dx \wedge dy$$

$$= (M'_{x} + N'_{y} + P'_{z}) dx \wedge dy \wedge dz$$

Differential forms and vector fields in \mathbb{R}^3

differential forms	vector fields
$\omega_f^0 = f(x, y, z)$ $\omega_f^3 = f dx \wedge dy \wedge dz$	function $f(x, y, z)$
$\omega_{\mathbf{F}}^{1} = Mdx + Ndy + Pdz \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Ndz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Mdz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Mdz \wedge dx + Pdx \wedge dy \iff \omega_{\mathbf{F}}^{2} = Mdy \wedge dz + Mdz \wedge dx + Pdx \wedge dy + Pdx \wedge dx $	vector field $\mathbf{F} = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k}$

Differentials:

$$\begin{array}{lcl} d\omega_f^0 & = & \omega_{grad(f)}^1 \\ d\omega_{\mathbf{F}}^1 & = & \omega_{curl(\mathbf{F})}^2 \\ d\omega_{\mathbf{F}}^2 & = & \omega_{div(\mathbf{F})}^3 \end{array}$$

Integrals:

dim = 0:
$$\int_a \omega_f^0 = f(a)$$
, where a is a point.

$$\dim = 1: \qquad \int_C \omega_{\bf F}^1 \quad = \quad \oint_C {\bf F} \cdot d{\bf r} \ , \quad \text{where C is a curve}.$$

$$\dim = 2: \qquad \int_{\Sigma} \omega_{\mathbf{F}}^2 \ = \ \iint_{\Sigma} \mathbf{F} \cdot \mathbf{n} \ dS \ , \quad \text{where Σ is a surface, and \mathbf{n} is the unit normal vector directed upward.}$$

$$\dim = 3$$
: $\int_D \omega_f^3 = \iiint_D f(x, y, z) dV$, where D is a solid region.

$\frac{\mbox{The Fundamental Theorem of}}{\mbox{Line Integrals}}$

$$\int_{\partial C} \omega_f^0 = \int_C \omega_{grad(f)}^1$$

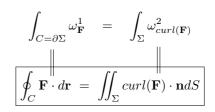

$$f(b) - f(a) = \oint_C grad(f) \cdot d\mathbf{r}$$

General Stokes's Theorem

$$\int_{\partial M} \omega = \int_{M} d\omega$$

where ω is a k-form; M is an oriented (k+1)-dimensional manifold; the orientation on ∂M is induced from M

Stokes's Theorem

The Divergence Theorem

$$\int_{\Sigma=\partial D} \omega_{\mathbf{F}}^2 = \int_{D} \omega_{div(\mathbf{F})}^3$$

$$\iiint_{\Sigma} \mathbf{F} \cdot \mathbf{n} dS = \iiint_{D} div(\mathbf{F}) dV$$
