Definition 1

A ribbion graph G is a surface with a boundary represented by closed topological discs called verticies V(G) and edges E(G), satisfying the following conditions

• the vertices and edges intersect by disjoint line segments

 each such line segment lies on the boundary of only one vertex and only one edge

every edge contains 2 line segments

Orientation of Ribbons

Definition 3

An arrow representation is the replacement of the edges of a ribbon graph with arrows satisfying the following conditions

- Every edge becomes 2 arrows that are on the 2 vertices the edge connects
- Each arrow is assigned a clockwise or counterclockwise orientation around the vertex it lies on
- If an edge is orientable both arrows associated to the edge have the same orientation. If an edge is non-orientable then both arrows associated with the edge have opposite orientations

Definition 4

Let $E' \subset E(G)$. The partial dual $G^{E'}$ of the graph G with respect to edges in E' is given by letting the line segments in E' now belong to $V(G^{E'})$ and adding an arrow to each side of the edges we are taking the dual of. Also, each pair of new arrows has the same orientation.

Remark 1

The following are properties of partial duality:

- If $e \notin E'$ then $(G^{E'})^{\{e\}} = G^{E' \cup e}$ ■ $(G^{E'})^{E'} = G$
 - Partial duality preserves orientability of ribbon graphs

 Partial duality conserves the number of connected components of a ribbon graph

For a Ribbon graph we can assign a function $\epsilon: E(G) \rightarrow \{+1, -1\}$ which assigns a sign to each edge of the Ribbon graph

Definition 7

With a signed ribbon graph we define the following functions that depend on the sign of an edge.

$$x_{\epsilon} = \begin{cases} x_{+} = 1 \\ x_{-} = (\frac{X}{Y})^{1/2} \end{cases}$$
(1)
$$y_{\epsilon} = \begin{cases} y_{+} = 1 \\ y_{-} = (\frac{Y}{X})^{1/2} \end{cases}$$

Definition 8

- *k*(*G*) := #(connected components of G)
- *bc*(*G*) := #(boundary components of G)
- The rank of a ribbon graph is r(G) := v(G) k(G)
- The nullity of a ribbon graph is n(G) := e(G) r(G)

Definition 9

The Bollobás Riordian polynomial is defined as follows where F is a sub-graph of G with the same number of vertices.

$$R_{G}(X,Y,Z) = \sum_{F \subseteq G} \left(\prod_{\epsilon \in F} x_{\epsilon}\right) \left(\prod_{\epsilon \notin F} y_{\epsilon}\right) X^{r(G)-r(F)} Y^{n(F)} Z^{k(F)-bc(F)+n(F)}$$

References

Remark 2

For signed ribbon graphs we alternate the signs of the dual edges in the partial dual graph. So for $e \in E'$ we have $\epsilon_G(e) = -\epsilon_{G^{\{E'\}}}(e)$

Theorem 10

The restriction of the polynomial

$$X^{k(G)}Y^{\nu(G)}Z^{\nu(G)+1}R_{G}(X,Y,Z)$$

to the surface $XYZ^2 = 1$ is invariant under partial duality. In other words, for any choice of edges E', if $G' = G^{\{E'\}}$ then

 $X^{k(G)}Y^{\nu(G)}Z^{\nu(G)+1}R_{G}(X,Y,Z)|_{XYZ^{2}=1}$

 $= X^{k(G')} Y^{v(G')} Z^{v(G')+1} R_{G'}(X,Y,Z)|_{XYZ^2=1}$

Theorem 12

Let $G_s^{\{E'\}}$ be the dual graph with respect to the set of edges E' of G_s . Let C' be the set of classical crossings of the knot that become the edges E' of G_s . if G_s is obtained from a Kauffman state s then $G_s^{\{E'\}} = G_{s'}$ where s' is the Kauffman state obtained by switching all A-splittings of crossings in C' to B-Splittings and vice versa.

Proof: Because of the equation, If $e \notin E'$ then $(G^{E'})^{\{e\}} = G^{E' \cup e}$, we need to only prove this theorem for the case where $E' = \{e\}$. Also, Since we have that $(G^{\{e\}})^{\{e\}} = G$ if $G^{\{e\}}$ will cause an A-splitting to switch to a B-splitting then we will also have that it will cause B-splittings to switch to A-splittings. Depicted below shows this partial dual when applied to an A-splitting.

Ribbon graphs Partial duality

Bollobás-Riordian polynomial

Ribbon Graphs and Knots

Recursive Relationships

References

In the paper [CV], for a specific state s' they called the Seifert state it was shown that:

$$\langle L \rangle (A, B, d) = A^{e(G_{s'})} \left(X^{k(G_{s'})} Y^{\nu(G_{s'})} Z^{\nu(G_{s'})+1} R_{G_{s'}}(X, Y, Z) \Big|_{X = \frac{Ad}{B}, Y = \frac{Bd}{A}, Z = \frac{1}{d}} \right)$$

So from the previous 2 theorems we have for any state s of a Knot

$$\langle L \rangle (A, B, d) = A^{e(G_s)} \left(X^{k(G_s)} Y^{\nu(G_s)} Z^{\nu(G_s)+1} R_{G_s}(X, Y, Z) \Big|_{X = \frac{Ad}{B}, Y = \frac{Bd}{A}, Z = \frac{1}{d}} \right)$$

Recursive Relationships

References

We obtain the following recursive relationships by substitution of the previous recursive relationships into the Kauffman bracket polynomial.

 If e is a non-orientable loop, nontrivial orientable loop, or and ordinary edge.

$$\langle L_G
angle = A_\epsilon \langle L_{G-e}
angle + A_{-\epsilon} \langle L_{G/e}
angle$$

If e is a bridge

$$\langle L_G \rangle = (-A_\epsilon)^3 \langle L_{G/e} \rangle$$

if e is a trivial orientable loop

$$\langle L_G \rangle = (-A_{-\epsilon})^3 \langle L_{G-e} \rangle$$

Open Question

Ribbon Graphs and the Bollobás-Riordan polynomial

G. Black

Ribbon graphs Partial duality

Bollobás-Riordian polynomial

Ribbon Graphs and Knots

Recursive Relationships

References

- The recursive relationships for the Kauffman bracket polynomial when restricted to planar ribbon graphs guarantee that we will never have a nontrivial or non-orientable loop.
- Also, all classical knots have a planar ribbon graph corresponding to one of their Kauffman brackets.
- The remaining recursive relationships are the exact same relationships that define Thistlethwaite's polynomial as defined in [BO]
- Is there a way to extend the Idea of [BO] to some a matrix that can recursively give the Kauffman bracket and Jones polynomial of an arbitrary ribbon graph and hence an arbitrary virtual knot?
