Sturmfels, Tevelev: [Elimination theory for tropical varieties](#) (2008)

MAC: [arXiv:1105.0509](#) (2011)

(and many, many more!)

Implicitization problem: Classical vs. tropical approach

Input: Laurent polynomials $f_1, f_2, \dots, f_n \in \mathbb{C}[t_1^{\pm 1}, \dots, t_d^{\pm 1}]$.

Algebraic Output: The *prime* ideal I defining the Zariski closure Y of the image of the map:

$$\mathbf{f} = (f_1, \dots, f_n): \mathbb{T}^d \dashrightarrow \mathbb{T}^n$$

The ideal I consists of all polynomial relations among f_1, f_2, \dots, f_n .

Existing methods: Gröbner bases and resultants.

- **GB:** always applicable, but often too slow.
- **Resultants:** useful when $n = d + 1$ and I is *principal*, with limited use.

Implicitization problem: Classical vs. tropical approach

- **GB:** always applicable, but often too slow.
- **Resultants:** useful when $n = d + 1$ and I is *principal*, with limited use.

Geometric Output: Invariants of Y , such as dimension, degree, etc.

Punchline: We can *effectively* compute them using tropical geometry.

TODAY: Study the case when $\mathbf{d} = 2$ and \mathbf{Y} is a surface .

Example: parametric surface in \mathbb{T}^3

Input: Three Laurent polynomials in two unknowns:

$$\begin{cases} x = f_1(s, t) = 3 + 5s + 7t, \\ y = f_2(s, t) = 17 + 13t + 11s^2, \\ z = f_3(s, t) = 19 + 47st, \end{cases}$$

Output: The **Newton polytope** of the implicit equation $g(x, y, z)$.

The Newton polytope of g is the convex hull in \mathbb{R}^3 of all lattice points (i, j, k) such that $x^i y^j z^k$ appears with *nonzero* coefficient in $g(x, y, z)$.

STRATEGY: Recover the Newton polytope of $g(x, y, z)$ from the **Newton polytopes** of the input polynomials f_1, f_2, f_3 .

$$Y = \begin{cases} x = f_1(s, t) = 3 + 5s + 7t, \\ y = f_2(s, t) = 17 + 13t + 11s^2, \\ z = f_3(s, t) = 19 + 47st, \end{cases} \rightsquigarrow \text{Newton polytope of } g(x, y, z).$$

$$Y = \begin{cases} x = f_1(s, t) = 3 + 5s + 7t, \\ y = f_2(s, t) = 17 + 13t + 11s^2, \\ z = f_3(s, t) = 19 + 47st, \end{cases} \rightsquigarrow \text{Newton polytope of } g(x, y, z).$$

$$Y = \begin{cases} x = f_1(s, t) = 3 + 5s + 7t, \\ y = f_2(s, t) = 17 + 13t + 11s^2, \\ z = f_3(s, t) = 19 + 47st, \end{cases}$$

\rightsquigarrow Newton polytope of $g(x, y, z)$.

$$Y = \begin{cases} x = f_1(s, t) = 3 + 5s + 7t, \\ y = f_2(s, t) = 17 + 13t + 11s^2, \\ z = f_3(s, t) = 19 + 47st, \end{cases}$$

\rightsquigarrow Newton polytope of $g(x, y, z)$.

\longleftrightarrow
 $f\text{-vector} = (5, 8, 5)$

$$Y = \begin{cases} x = f_1(s, t) = 3 + 5s + 7t, \\ y = f_2(s, t) = 17 + 13t + 11s^2, \\ z = f_3(s, t) = 19 + 47st, \end{cases} \rightsquigarrow \text{Newton polytope of } g(\mathbf{x}, \mathbf{y}, z).$$

\longleftrightarrow
f-vector = (5, 8, 5)

- Γ is a balanced weighted *planar* graph in \mathbb{R}^3 . It is the **tropical variety** $\mathcal{T}(g(\mathbf{x}, \mathbf{y}, z))$, dual to the Newton polytope of g .
- We can recover $g(\mathbf{x}, \mathbf{y}, z)$ from Γ using *numerical linear algebra*.

What is Tropical Geometry?

Given a variety $X \subset \mathbb{T}^n$ with defining ideal $I \subset \mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]$, the **tropicalization** of X equals:

$$\mathcal{T}X = \mathcal{T}I := \{w \in \mathbb{R}^n \mid \text{in}_w(I) \text{ contains no monomial}\}.$$

What is Tropical Geometry?

Given a variety $X \subset \mathbb{T}^n$ with defining ideal $I \subset \mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]$, the **tropicalization** of X equals:

$$\mathcal{T}X = \mathcal{T}I := \{w \in \mathbb{R}^n \mid \text{in}_w(I) \text{ contains no monomial}\}.$$

- 1 It is a **rational polyhedral fan** in $\mathbb{R}^n \rightsquigarrow \mathcal{T}X \cap \mathbb{S}^{n-1}$ is a spherical polyhedral complex.
- 2 If I is prime, then $\mathcal{T}X$ is **pure** of the **same dimension** as X .
- 3 Maximal cones have canonical **multiplicities** attached to them. With these multiplicities, $\mathcal{T}X$ satisfies the **balancing condition**.

Example (hypersurfaces):

- $\mathcal{T}(g)$ is the union of all codim. 1 cones in the (inner) normal fan of the Newton polytope $\text{NP}(g)$.
- Maximal cones in $\mathcal{T}(g)$ are dual to edges in $\text{NP}(g)$, and m_σ is the lattice length of the associated edge.
- Multiplicities are **essential** to recover $\text{NP}(g)$ from $\mathcal{T}(g)$.

What is Geometric Tropicalization?

AIM: Given $Z \subset \mathbb{T}^N$ a **surface**, compute $\mathcal{T}Z$ from the *geometry* of Z .

KEY FACT: $\mathcal{T}Z$ can be characterized in terms of **divisorial valuations**.

What is Geometric Tropicalization?

AIM: Given $Z \subset \mathbb{T}^N$ a **surface**, compute $\mathcal{T}Z$ from the *geometry* of Z .

KEY FACT: $\mathcal{T}Z$ can be characterized in terms of **divisorial valuations**.

Theorem (Geometric Tropicalization [Hacking - Keel - Tevelev])

Consider \mathbb{T}^N with coordinate functions χ_1, \dots, χ_N , and let $Z \subset \mathbb{T}^N$ be a closed smooth **surface**. Suppose $\bar{Z} \supset Z$ is any smooth compactification, whose boundary divisor has m irreducible components D_1, \dots, D_m with no triple intersections (**C.N.C.**). Let Δ be the graph:

$$V(\Delta) = \{1, \dots, m\} \quad ; \quad (i, j) \in E(\Delta) \iff D_i \cap D_j \neq \emptyset.$$

Realize Δ as a graph $\Gamma \subset \mathbb{R}^N$ by $[D_k] := (\text{val}_{D_k}(\chi_1), \dots, \text{val}_{D_k}(\chi_N)) \in \mathbb{Z}^N$.

Then, $\mathcal{T}Z$ is the **cone over the graph** Γ .

What is Geometric Tropicalization?

AIM: Given $Z \subset \mathbb{T}^N$ a **surface**, compute $\mathcal{T}Z$ from the *geometry* of Z .

KEY FACT: $\mathcal{T}Z$ can be characterized in terms of **divisorial valuations**.

Then, $\mathcal{T}Z$ is the **cone over the graph** Γ .

Theorem (Combinatorial formula for multiplicities [C.]

$$m_{([D_i], [D_j])} = (D_i \cdot D_j) \left[(\mathbb{Z}\langle [D_i], [D_j] \rangle)^{\text{sat}} : \mathbb{Z}\langle [D_i], [D_j] \rangle \right]$$

QUESTION: How to compute $\mathcal{T}Y$ from a parameterization

$$\mathbf{f} = (f_1, \dots, f_n): \mathbb{T}^2 \dashrightarrow Y \subset \mathbb{T}^n \quad ?$$

QUESTION: How to compute $\mathcal{T}Y$ from a parameterization

$$\mathbf{f} = (f_1, \dots, f_n): \mathbb{T}^2 \dashrightarrow Y \subset \mathbb{T}^n \quad ?$$

ANSWER: Compactify the domain $X = \mathbb{T}^2 \setminus \bigcup_{i=1}^n (f_i = 0)$ and use the map \mathbf{f} to translate back to Y .

Proposition

Given $\mathbf{f}: X \subset \mathbb{T}^2 \rightarrow Y \subset \mathbb{T}^n$ generically finite map of degree δ , let \bar{X} be a smooth, CNC compactification with associated intersection complex Δ . Map each vertex D_k of Δ in \mathbb{Z}^n to a vertex \widetilde{D}_k of $\Gamma \subset \mathbb{R}^n$, where

$$[\widetilde{D}_k] = \text{val}_{D_k}(\chi \circ f) = f^\#([D_k]).$$

Then, $\mathcal{T}Y$ is the cone over the graph $\Gamma \subset \mathbb{R}^n$, with multiplicities

$$m_{([\widetilde{D}_i], [\widetilde{D}_j])} = \frac{1}{\delta} (D_i \cdot D_j) \left[(\mathbb{Z}\langle [\widetilde{D}_i], [\widetilde{D}_j] \rangle)^{\text{sat}} : \mathbb{Z}\langle [\widetilde{D}_i], [\widetilde{D}_j] \rangle \right].$$

Implicitization of *generic* surfaces

SETTING: Let $f = (f_1, \dots, f_n): \mathbb{T}^2 \dashrightarrow Y \subset \mathbb{T}^n$ of $\deg(f) = \delta$, where

- each $f_i \in \mathbb{C}[t_1^{\pm 1}, t_2^{\pm 1}]$ is irreducible and has **fixed Newton polytope**,
- we assume **generic coefficients**.

GOAL: Compute the graph Γ of $\mathcal{T}Y$ from the Newton polytopes $\{\mathcal{P}_i\}_{i=1}^n$.

Implicitization of *generic* surfaces

SETTING: Let $f = (f_1, \dots, f_n): \mathbb{T}^2 \dashrightarrow Y \subset \mathbb{T}^n$ of $\deg(f) = \delta$, where

- each $f_i \in \mathbb{C}[t_1^{\pm 1}, t_2^{\pm 1}]$ is irreducible and has **fixed Newton polytope**,
- we assume **generic coefficients**.

GOAL: Compute the graph Γ of $\mathcal{T}Y$ from the Newton polytopes $\{\mathcal{P}_i\}_{i=1}^n$.

IDEA: Compactify X inside the proj. toric variety $X_{\mathcal{N}}$, where \mathcal{N} is the common refinement of all $\mathcal{N}(P_i)$. **Generically**, \overline{X} is smooth with **CNC**.

Implicitization of *generic* surfaces

SETTING: Let $f = (f_1, \dots, f_n): \mathbb{T}^2 \dashrightarrow Y \subset \mathbb{T}^n$ of $\deg(f) = \delta$, where

- each $f_i \in \mathbb{C}[t_1^{\pm 1}, t_2^{\pm 1}]$ is irreducible and has **fixed Newton polytope**,
- we assume **generic coefficients**.

GOAL: Compute the graph Γ of $\mathcal{T}Y$ from the Newton polytopes $\{\mathcal{P}_i\}_{i=1}^n$.

IDEA: Compactify X inside the proj. toric variety $X_{\mathcal{N}}$, where \mathcal{N} is the common refinement of all $\mathcal{N}(\mathcal{P}_i)$. **Generically**, \overline{X} is smooth with **CNC**.

The vertices and edges of the boundary intersection complex Δ are

$$V(\Delta) = \{E_i : \dim \mathcal{P}_i \neq 0, 1 \leq i \leq n\} \cup \{D_\rho : \rho \in \mathcal{N}^{[1]}\},$$

- $(D_\rho, D_{\rho'}) \in E(\Delta)$ iff ρ, ρ' are *consecutive* rays in \mathcal{N} .
- $(E_i, D_\rho) \in E(\Delta)$ iff $\rho \in \mathcal{N}(\mathcal{P}_i)$.
- $(E_i, E_j) \in E(\Delta)$ iff $(f_i = f_j = 0)$ has a solution in \mathbb{T}^2 .

Then, Γ is the realization of Δ via

$$[E_i] := e_i \quad (1 \leq i \leq n) \quad , \quad [D_\rho] := \left(\min_{\alpha \in \mathcal{P}_i} \{\alpha \cdot \eta_\rho\} \right)_{i=1}^n \quad \forall \rho \in \mathcal{N}^{[1]},$$

where η_ρ is the primitive lattice vector generating ρ .

Tropical implicitization of *generic* surfaces

Theorem (Sturmfels-Tevelev-Yu, C.)

The tropical variety \mathcal{TY} is the *cone over the graph Γ* , with multiplicities

- $m_{([D_\rho], [D_{\rho'}])} = \frac{1}{\delta} \frac{\gcd\{2\text{-minors of } ([D_\rho][D_{\rho'}])\}}{|\det(\eta_\rho | \eta_{\rho'})|}$, for ρ, ρ' consec. rays in \mathcal{N} .
- $m_{(e_i, [D_\rho])} = \frac{1}{\delta} (|\text{face}_\rho \mathcal{P}_i \cap \mathbb{Z}^2| - 1) \gcd\{[D_\rho]_j : j \neq i\}$, for $\rho \in \mathcal{N}_i^{[1]}$.
- $m_{(e_i, e_j)} = \frac{1}{\delta} \text{length}((f_i = f_j = 0) \cap \mathbb{T}^2)$, if $\dim(\mathcal{P}_i + \mathcal{P}_j) = 2$.

Under further genericity assumptions,

$$\text{length}((f_i = f_j = 0) \cap \mathbb{T}^2) = MV(\mathcal{P}_i, \mathcal{P}_j).$$

Implicitization of *non-generic* surfaces

Non-genericity \leftrightarrow CNC/smoothness condition is *violated*, i.e. triple intersections among:

$E_i = (f_i = 0)$'s only or E_i 's and D_ρ 's combined.

Implicitization of *non-generic* surfaces

Non-genericity \leftrightarrow CNC/smoothness condition is *violated*, i.e. triple intersections among:

$E_i = (f_i = 0)$'s only or E_i 's and D_ρ 's combined.

- Solution 1:**
- 1 Embed X in $X_{\mathcal{N}}$.
 - 2 Resolve triple intersections and singularities by *classical blow-ups*, and carry divisorial valuations along the way.

Implicitization of *non-generic* surfaces

Non-genericity \leftrightarrow CNC/smoothness condition is *violated*, i.e. triple intersections among:

$$E_i = (f_i = 0)\text{'s only} \quad \text{or} \quad E_i\text{'s and } D_\rho\text{'s combined.}$$

Solution 1:

- ① Embed X in $X_{\mathcal{N}}$.
- ② Resolve triple intersections and singularities by *classical blow-ups*, and carry divisorial valuations along the way.

Solution 2:

- ① Embed X in $\mathbb{P}_{(s,t,u)}^2 \rightsquigarrow n+1$ boundary divisors
$$E_i = (f_i = 0) \quad (1 \leq i \leq n), \quad E_\infty = (u = 0).$$
- ② Resolve triple intersections and singularities by *blow-ups* $\pi: \tilde{X} \rightarrow X$, and read divisorial valuations by *columns*

$$(f \circ \pi)^*(\chi_i) = \pi^*(E_i - \deg(f_i)E_\infty) = E'_i - \deg(f_i)E'_\infty - \sum_{j=1}^r b_{ij}H_j \quad \forall i.$$

The graph Δ is obtained by *gluing resolution diagrams* and adding pairwise intersections.

Example (non-generic surface)

$$Y = \begin{cases} x = f_1(s, t) = s - t, \\ y = f_2(s, t) = t - s^2, \\ z = f_3(s, t) = -1 + s t, \end{cases}$$

(7, 11, 6)

Example (non-generic surface)

$$Y = \begin{cases} x = f_1(s, t) = s - t, \\ y = f_2(s, t) = t - s^2, \\ z = f_3(s, t) = -1 + s t, \end{cases}$$

(7, 11, 6)

Affine Charts:

Affine Charts:

Further remarks

- ① If $\dim Z > 2$, **geometric tropicalization** requires the boundary of a compactification \overline{Z} to have **simple normal crossings**.

Theorem ([C.])

We can replace *S.N.C.* with **combinatorial N.C.** in any dimension.

- Can we take advantage of this fact to gain effectiveness?

Further remarks

- ① If $\dim Z > 2$, **geometric tropicalization** requires the boundary of a compactification \bar{Z} to have **simple normal crossings**.

Theorem ([C.])

We can replace *S.N.C.* with **combinatorial N.C.** in any dimension.

- ▶ Can we take advantage of this fact to gain effectiveness?
- ② Special surfaces are tropicalized via **resolution of singularities**, which is hard to do in practice.
 - ▶ Is there an **alternative** approach? \rightsquigarrow combinatorial resolutions?
 - ▶ Can we **predict** the graph Γ from the topology/geometry of the singularities on the domain X ? \rightsquigarrow Enriques/dual diagrams, clusters of infinitely near points, ...

Further remarks
