Warm-Up: Let P(x) be a sentence depending on x & A. Prove that $(\forall x \in A) P(x) \implies (\exists x \in A) P(x)$ is a tantology.

The Principle of Mathematical Induction Let P(n) be a sentence involving ne IN. Ex: $P(n) = \frac{n(n+1)}{2}$

The POMI is: Suppose

and

(2) For any nEN, if P(n) is true, then P(n+1) is true. [inductive step]

Then P(n) is true for every n N.

In symbols: $\left\{P(1) \wedge \left[\left(\forall n \in IN\right)\left(P(n) \Rightarrow P(n+1)\right)\right]\right\} \Rightarrow \left(\forall n \in IN\right) P(n)$

The PoMI is an axiom of the integers. It is assumed to be true by definition.

Why should ne accept it? Intuition - dominoes, trains, etc.

Thm: For all neIN,
$$\frac{2}{i=1}$$
: = $\frac{n(n+1)}{2}$

Proof: Let P(n) be "
$$\frac{2}{2}i = \frac{n(n+1)}{2}$$
."
We will prove $(\forall n \in \mathbb{N}) P(n)$ by induction on n.

Base Case: When
$$n = 1$$
,
$$\frac{1}{2}i = 1 \quad \text{and} \quad \frac{1(1+1)}{2} = 1,$$
so $P(1) = \frac{1}{2}i = \frac{1(1+1)}{2}i$ is true.

Suppose
$$P(n)$$
 is true. That is,

$$\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$$

for this particular number n.

$$50 \ 1+2+3+\cdots+n=\frac{n(n+1)}{2}$$

Add n+1 to both sides:

This is precisely P(n+1). So P(n+1) is true, completing the inductive step.

We conclude, by mathematical induction, that P(n) is true for every $n \in \mathbb{N}$.

Thm: For every $n \in \mathbb{N}$, $1 + 3 + 5 + \cdots + (2n-1) = n^2.$ $= \frac{2}{5}(2:-1)$

Proof: We proceed by induction on n.

Let P(n) be "1+3+5+...+ (2n-1) = n?"

Base Case: When n=1, P(1) is $|| 1 = ||^2||$

which is true.

Inductive Step: Let neIN. We wish to prove $P(n) \Rightarrow P(n+1)$, so we may assume P(n).

Thus, $1+3+5+\cdots+(2n-1)=n^2$

is true (for this n).

$$\begin{aligned} 1 + 3 + 5 + \cdots + (2n-1) + \left[2(n+1) - 1 \right] \\ &= n^2 + \left[2n + 2 - 1 \right] \\ &= n^2 + 2n + 1 \\ &= (n+1)^2. \end{aligned}$$

Thus, we have shown that P(n+1) is true, completing the inductive step.

By induction, we conclude that P(n) is true for all ne IV.

Does the base case have to be n=1?

No!

Check:
$$2^3 = 8 > 6 = 3! \times 2^4 = 16 < 24 = 4! \times 2^5 = 32 < 120 = 5! \times 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 = 5! < 2^6 = 32 < 120 < 120 = 5! < 2^6 = 32 < 120 < 120 = 5! < 2^6 = 32 < 120 < 120 < 120$$

Proof: Let P(n) be "2" < n!"
We will show P(n) is true for every
n & N with n>3 by induction.

Base Case: n=4. Since 24=16 and 4!=24, P(4) is true.

Inductive Step: Let $n \in \mathbb{N}$ such that n > 3. We must prove $P(n) \Rightarrow P(n+1)$.

Assume P(n) is true, so 2° < n!

Multiply by 2 to get

2.2° < 2 n!

Since 2434n4n+1, we have $2^{n+1} 42n! 4(n+1)n! = (n+1)!$

Thus, P(n+1) is true, completing the inductive step.

We conclude that P(n) is true for every $n \in \mathbb{N}$ such that n > 3.

Note: We could have equivalently set $Q(n) = P(n+3) = "2^{n+3} 4 (n+3)!"$ and proved $(\forall n \in \mathbb{N}) Q(n)$ by induction starting at n=1.
