

5pt **A1.** If  $M$  is a finitely generated module over a PID, prove that  $M$  is flat iff  $M$  is projective iff  $M$  is torsion-free iff  $M$  is free.

*Solution.* If  $M$  is free, then it is projective, if  $M$  is projective, then  $M$  is flat, and if  $M$  is flat, then  $M$  is torsion-free. However, for finitely generated modules of finite rank over a PID, being free and being torsion-free is the same.

5pt **A2.** Give an example of a module  $M$  over an integral domain  $R$  such that  $M$  is torsion-free but not free and (a)  $M$  is finitely generated but  $R$  is not a PID.

*Solution.*  $R = F[x, y]$ , where  $F$  is a field, and  $M = (x, y)$ . Since  $M/(x)$  is a torsion module,  $M$  has rank 1. However,  $M$  is not generated by a single element: for no  $p(x, y) \in M$  both  $x$  and  $y$  are multiples of  $p$ .

5pt (b)  $R$  is a PID but  $M$  is not finitely generated.

*Solution.*  $R = \mathbb{Z}$ ,  $M = \mathbb{Q}$ .  $M$  has rank 1, but not generated by a single element (and is not, actually, finitely generated).

**A3.** Let  $M$  be a free  $\mathbb{Z}$ -module of rank 4,  $M_1 \cong M/N_1$  and  $M_2 \cong M/N_2$ , where  $N_1$  is a subgroup (submodule) of  $M$  generated, in some basis  $\{u_1, \dots, u_4\}$  of  $M$ , by  $\{u_1, 2u_2, 6u_3\}$ , and  $N_2$  is a subgroup of  $M$  generated, in some basis  $\{v_1, \dots, v_4\}$  of  $M$ , by  $\{v_1, 3v_2, 6v_3\}$ .

5pt (a) Are the modules  $N_1$  and  $N_2$  isomorphic?

*Solution.* The vectors  $u_1, 2u_2, 6u_3$  are linearly independent, so  $N_1$  is a free  $\mathbb{Z}$ -module of rank 3. Similarly,  $N_2$  is a free  $\mathbb{Z}$ -module of rank 3. Hence,  $N_1 \cong N_2$ .

5pt (b) What are the ranks of the modules  $M_1$  and  $M_2$ ?

*Solution.*  $\text{rank } M_1 = 4 - \text{rank } N_1 = 1$  and  $\text{rank } M_2 = 4 - \text{rank } N_2 = 1$ .

5pt (c) Are the modules  $M_1$  and  $M_2$  isomorphic?

*Solution.* No:  $M_1 \cong \mathbb{Z}_2 \times \mathbb{Z}_6$  and has invariant factors 2 and 6;  $M_2 \cong \mathbb{Z}_3 \times \mathbb{Z}_6$  and has invariant factors 3 and 6.

**A4.** Let  $N$  be the sublattice of  $\mathbb{Z}^3$  generated by the vectors  $\begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix}$ ,  $\begin{pmatrix} -1 \\ -1 \\ 1 \end{pmatrix}$  and  $\begin{pmatrix} 1 \\ -1 \\ 3 \end{pmatrix}$ , and let  $M = \mathbb{Z}^3/N$ .

5pt (a) Find the invariant factors of  $M$ .

*Solution.* The relations matrix of  $M$  (a matrix, whose columns generate  $N$ ) is  $\begin{pmatrix} 1 & -1 & 1 \\ -1 & -1 & -1 \\ 1 & 1 & 3 \end{pmatrix}$ . Using row-column operations over  $\mathbb{Z}$ , we transform it this way:

$$\begin{pmatrix} 1 & -1 & 1 \\ -1 & -1 & -1 \\ 1 & 1 & 3 \end{pmatrix} \mapsto \begin{pmatrix} 1 & -1 & 1 \\ 0 & 0 & -2 \\ 0 & 2 & 2 \end{pmatrix} \mapsto \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & -2 \\ 0 & 2 & 2 \end{pmatrix} \mapsto \begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 2 \\ 0 & 0 & -2 \end{pmatrix} \mapsto \begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{pmatrix}$$

and obtain that the invariant factors of  $M$  are 2, 2.

5pt (b) Determine the cardinality of  $M$ .

*Solution.* From (a), it follows that  $M \cong \mathbb{Z}/(2) \oplus \mathbb{Z}/(2) = \mathbb{Z}_2^2$ , and the cardinality of  $M$  is 4.

5pt **A5.** Let  $G$  be an (additively written) abelian group defined by its generators  $u_1, u_2, u_3, u_4$  and relations  $2u_1 + 4u_2 + 10u_3 + 2u_4 = 0$  and  $4u_1 = 2u_2 + 6u_4$ . Represent  $G$  as a product of cyclic groups.

*Solution.* The relations matrix of  $G$  is  $\begin{pmatrix} 2 & 4 \\ 4 & -2 \\ 10 & 0 \\ 2 & -6 \end{pmatrix}$ . Using row-column operations over  $\mathbb{Z}$ , we transform it this way:

$$\begin{pmatrix} 2 & 4 \\ 4 & -2 \\ 10 & 0 \\ 2 & -6 \end{pmatrix} \mapsto \begin{pmatrix} 2 & 4 \\ 0 & -10 \\ 0 & -20 \\ 0 & -10 \end{pmatrix} \mapsto \begin{pmatrix} 2 & 0 \\ 0 & -10 \\ 0 & -20 \\ 0 & -10 \end{pmatrix} \mapsto \begin{pmatrix} 2 & 0 \\ 0 & 10 \\ 0 & 0 \\ 0 & 0 \end{pmatrix}.$$

Hence, the rank of  $G$  is 2, the invariant factors of  $G$  are 2 and 10, and  $G \cong \mathbb{Z}^2 \times \mathbb{Z}_2 \times \mathbb{Z}_{10}$ .

5pt **12.2.4.** Prove that  $3 \times 3$  matrices over a field are similar iff they have the same characteristic and the same minimal polynomials.

*Solution.* In one direction this is clear: similar matrices have the same characteristic and the same minimal polynomials.

Let  $A$  be a  $3 \times 3$  matrix with minimal polynomial  $m_A$  and characteristic polynomial  $c_A$ . If  $\deg m_A = 3$ , then  $m_A$  is the only invariant factor of  $A$ . If  $\deg m_A = 2$ , then  $A$  has two invariant factors,  $p_2 = m_A$  and  $p_1 = c_A/m_A$  of degree 1. If  $\deg m_A = 1$ , then, since all other invariant factors of  $A$  must divide  $m_A$ ,  $A$  has three invariant factors all equal to  $m_A$ . In any case the invariant factors of  $A$  are uniquely deined by  $m_A$  and  $c_A$ , so all  $3 \times 3$  matrices with minimal polynomial  $m_A$  and characteristic polynomial  $c_A$  are similar.

5pt **12.2.10.** Find all similarity classes of  $6 \times 6$  matrices over  $\mathbb{Q}$  with minimal polynomial  $(x + 2)^2(x - 1)$ .

*Solution.* If  $A$  is a  $6 \times 6$  matrix with the minimal polynomial  $m_A = (x + 2)^2(x - 1)$ , the other invariant factors of  $A$  must divide  $m_A$  and one the other, and have total degree 3; the only options are:

one more polynomial  $(x + 2)^2(x - 1)$ ;

two more polynomials  $(x + 2)$  and  $(x + 2)(x - 1)$ ;

two more polynomials  $(x - 1)$  and  $(x + 2)(x - 1)$ ;

two more polynomials  $(x + 2)$  and  $(x + 2)^2$ ;

three more polynomials  $(x + 2)$ ,  $(x + 2)$ ,  $(x + 2)$ ;

three more polynomials  $(x - 1)$ ,  $(x - 1)$ ,  $(x - 1)$ .

The similarity classes of such matrices correspond to these 6 distinct sets of invariant factors.

5pt **12.2.18.** Let  $V$  be a finite dimensional vector space over  $\mathbb{Q}$  and suppose  $T$  is a nonsingular (invertible) linear transformation of  $V$  such that  $T^{-1} = T^2 + T$ . Prove that  $\dim V$  is divisible by 3 and that all such transformations of  $V$  are similar.

*Solution.* Multiplying the identity  $T^2 + T = T^{-1}$  by  $T$  we get that  $T^3 + T^2 = I$ , so  $p(T) = 0$  for  $p(x) = x^3 + x^2 - 1$ .  $p$  is irreducible in  $\mathbb{Q}[x]$  (otherwise it would have a root in  $\mathbb{Z}$  equal to  $\pm 1$ , which is not the case). Thus  $p$  is the minimal polynomial for  $T$ , and all other invariant factors of  $T$  must divide  $p$  and so, be equal to  $p$ . Hence,  $\dim V = 3k$  where  $k$  is the nuber of invariant factors of  $T$ , and all such transformation of  $V$  have the same set of invariant factors and so, are similar.
